Olkusz Z., Eng. "Longwall Armoured Conveyors." (Przenosnik pancerny na scianie). Przeglad Gorniczy, No. 1-2, 1950, pp. 23-26, 8 figs.

The use of the armoured conveyor in mining a thick seam at from 3 to 10 deg. incline by layers 3-4 metres thick with hydraulic stowage, and in mining a thinner seam (4.7 metres) also with hydraulic stowing. Both seams are worked with longwall method without undercutting. The introduction of the armoured conveyor raised the output, including the stowing, to 8.2 tons per day in a wall 60 m long. Suggestions for a further increase in work efficiency.

Title : Utilization of Leaf Diagnostics

Orig Pub : Fiziol. rasteniy, 1956, 3, No 6, 554-573

Abstract : A large amount of experimental work on leaf diagnostics in Africa with olive plants, coconut and peanut crops is summarized. Stressed to a large extent is the complex relationship between the nutrient element leaf content and the harvest yield. With fertilizer application, in case of an acute deficiency of the element being studied, its content in the leaves may not increase, since plant growth is intensified, and

Abs Jour : Ref Zhur - Biologiya, No 11, 1958, No. 48641

with a well nourished plant an increase of the element content in the leaf is not accompanied by intensified growth. For individual regions with the aid of leaf diagnostics, it is necessary to determine their critical levels for each plant which would give an indication as to the necessity of fertilizer application. Leaf diagnostics permits an explanation of field experiment results, raising empirical experimentation to the level of scientific prognosis. It was shown in practice that exact chemical analysis requires less time than conducting quick tests in the field. -- Z. I. Zhurbitskiy

TITLE: Observation of radiation over Australia with the aid of Soviet satellite 1958-δ

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 6, 1961, 11, abstract 6G77. (Tr. Mezhdunar. konferentsii po kosmich. lucham, 1959, T. 3.. Moscow, AN SSSR, 1960, 36-45)

TEXT: The authors report on radiation intensity measurements based on data from the third Soviet artificial satellite for July-August 1958. A scintillation counter mounted on the satellite made it possible to register effectively photons of electron bremsstrahlung with about 100 kev energy and fast charged particles. Incident to the reception of signals the satellite was at an altitude of 1,750-1,807 km in the region of 20.6-47.9°s.lat., 146.5-163.7°e.long.. The radiation intensity attains a minimum at 35°s.lat. and increases in order for a change in latitude of ±10°. It is assumed that this minimum is the transition zone between the

TITLE: Karst Formations of the Bol'shoy Karatau Mountain Range
(Karst khrebt Bol'shoy Karatau)

PERIODICAL: Byulleten' Moskovskogo obshchestva ispytateley prirody,
Otdel geologicheskiy, 1958, Nr 3, pp 73-88 (USSR)

ABSTRACT: The author publishes the result of 3 years of study of karst formations of the Bol'shoy Karatau mountain range. No special studies were conducted during the first half of this century on the karst formations of this area. In 1943, V.V. Galitskiy subdivided karst formations into 2 types: karst containing carbonic acid and those containing sulfuric acid compounds. Recently, the Moscow Geologic-Prospecting Institute started geologic-morphological research of the Bol'shoy Karatau by sending out the South Kazakhstan expedition, headed by G.I. Raskatov. In 1952-1954, V.N. Razumova studied the Mesozoic and Cenozoic deposits, and succeeded in accurately determining the age of karst formations. It was found that deposits of different age formed the mountains of the Bol'shoy Karatau, ranging from the Pre-Cambrian to the Quaternary Period (Figure 1). The geologic formation of the

Card 1/3

SOV-5-58-3-5/39

Karst Formations of the Bol'shoy Karatau Mountain Range

Bol'shoy Karatau took place in 2 phases: the Geosyncline Period from the Pre-Cambrian to the Middle Carboniferous, and the period following the Hercinian folding at the end of the Middle Carboniferous, at which time the entire area underwent an uplift and subsequently developed into a plateau. The absence of Upper Paleozoic and Triassic deposits leads to the conclusion that this region was lifted from below sea level at the end of the Paleozoic Era, while the Jurassic Period was a period of activated tectonic processes. At the beginning of the Cretaceous Period the surface of the Bol'shoy Karatau range was a denuded plain with slight depressions covered with sediments of red clay. A dome-like elevation of the Paleogene Period became temporarily submerged below the sea surface, which was uplifted during the Pliocene Epoch. At the present time, the basic relief of the Central Karatau is composed of an eroded Paleogene surface, but consists of Upper Cretaceous formations at the Boroldaysk Mountains. The author gives detailed descriptions

Card 2/3

SOV-5-58-3-5/39

Karst Formation of the Bol'shoy Karatau Mountain Range

of morphologic structures of surface and subsurface karst formations, and cites several regularities of karst forming. There is 1 map, 1 chart, 1 sketch, 3 photos, and 11 Soviet references.

TITLE: French solutions to the problem of multi-fuel engines

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk. 42. Silovyye ustavovki, no. 9, 1962, 65, abstract 42.9.390. In collection "5-y Mezhdunar. nest. kongress, 1959". M., Gostoptekhizdat, v. 4, 1961, 201-202

TEXT: The report analyzes the problems of using different fuels (both of the diesel and high-octane grade) in piston engines without changing their basic design. The most efficient method proved to be fuel injection into the combustion chamber at two different, exactly established time intervals, within a single cycle. This method ensures maximum control of the combustion process and may be used for light-fraction fuels, for combustion of various fuel grades in case of difficulties in normal fuel supply, for reduction of diesel engine vibration and smoking at the exhaust pipe as well as for the increase in maneuverability and power output.

TITLE: Stability of an Elastic Circular Cylindrical Shell Subject to High External Lateral Pressures (Ustoychivost' uprugoy krugovoy tsilindricheskoy obolochki pri bol'sikh vneshnikh bokovykh davleniyakh)

PERIODICAL: Tr. Tallinsk. politekhn. in-ta, 1955, Vol A, Nr 65, pp 54-60

ABSTRACT: An investigation is made into the change in the potential energy of shells of medium length on transition from an axisymmetrical type of equilibrium to a non-asymmetrical one. The function for the dimensionless normal flexure is given as follows:

$$w = (c_1 \sin \frac{\pi R}{L} \xi + c_3 \sin \frac{3\pi R}{L} \xi) \cos s\theta + \frac{s^2}{4} (c_1 \sin \frac{\pi R}{L} \xi + c_3 \sin \frac{3\pi R}{L} \xi)^2$$

Card 1/2

where θ and ξ are the coordinates of the middle surface in the peripheral and longitudinal directions; R and L being the radius and the length of the shell, respectively. Next, the stress function is

SOV/124-57-5-5882

Stability of an Elastic Circular Cylindrical Shell Subject to High External (cont.)

determined, and the potential energy of the shell is calculated. The conditions for the external value of the energy according to the three independent parameters c_1 , c_2 , and λ lead to the derivation of a system of algebraic equations making it possible to find the relationship of the potential energy of the shell and the magnitude of the external pressure, p . This relationship is presented graphically in dimensionless form. The appended graph shows non-axisymmetrical forms of equilibrium to be possible when $p > 0.62p^*$. When $p > 0.74p^*$, the potential energy of the non-axisymmetrical form of equilibrium is less than the energy of the axisymmetrical form. Here p^* is the upper critical pressure in a shell of medium length, and is determined by the equation.

$$p^* = \frac{0.85E}{(1-\mu^2)^{3/4}} \frac{t}{L} \left(\frac{t}{R}\right)^{3/2}$$

where t is the thickness of the shell.

TITLE:

On Axisymmetrical Oscillations of Circular-cylindric Thin-walled
Shells

PERIODICAL:

Tr. Tallinsk. politekhn. in-ta, 1958, Vol. A, No. 147, pp. 15-30

TEXT: Steady axisymmetrical oscillations of closed circular-cylindric shells are considered. The forces of rotational inertia and shear deformations are not taken into account, also oscillations of very high frequencies are not considered. The results from the simplified calculation approximately coincide with the results from the exact calculation, provided that

$$\alpha_* > 5n\delta$$
 where α_* is the critical length of the shell related to the diameter; n is the number of half-waves in the cylinder; δ is the ratio of the shell thickness to the radius of the median surface. Tables are added for determining the critical length α_* of a shell, the edges of which are free or jammed, in case when the Poisson coefficient amounts to $\nu = 0.3$. It is stated that a further simplification of the calculation, according to the proposal of V. Ye. Breslavskiy (Inzhenernyy

TITLE: Corpuscular model of a material in the strength of materials

SOURCE: Tallinn. Politekhnicheskiy institut. Trudy. Seriya A, no. 227, 1965. Sbornik statey po soprotivleniyu materialov, stroitel'noy mehanike i stroitel'noy fizike
(Collection of articles on resistance of materials, structural mechanics and structural physics), 3-40

TOPIC TAGS: material strength, elasticity, material deformation, elasticity theory, elastic deformation, model

ABSTRACT: Certain applications of a new model for use in studies of the strength of materials are presented. In place of the commonly accepted concept of a material as a uniform substance, the proposed model is made in consideration of the real corpuscular structure of the material. On this basis the work and behavior of the material is studied at varying stress conditions. Figure 1 is an illustration of the mathematical representation of corpuscle dimension. These dimensions are considered to be infinitesimally small, so that a condition of mathematical continuity of the material body exists. External and internal forces are then discussed as they are applied

Fig. 1.

through corpuscular interactions. The model permits an explanation not only of compressive force interactions, but also the elastic properties of a material, tensile force interactions, and the deformed state of the material. A new shear characteristic is introduced, called the H modulus. For constant μ and E, this modulus remains constant even at large deformations. Mechanisms and causes of failure are studied in the context of the proposed model, and material properties characterized by the Poisson coefficient are related to strength evaluations. The proposed tensile stress analog does not involve the introduction of new formulae in the theory of material strength, and the transition to the study of body deformations does not involve mathematical complexities. A physical basis for the stressed condition is given; this concept holds that, during body deformation, the number of corpuscles bearing on adjacent facets (grains) remains constant. With this model, the domain of the linear theory of elasticity is expanded inasmuch as for constant μ and E (and hence, constant H), shear, compressive, and tensile distortions are linear functions of stress, even for large deformations. OELLINGER, K.

52. The work of the Machine Factory for the Light Industry on behalf of the wood industry -- A Konnyuipari Cepgyvar munkaja a faipar erdekeben -- by K. Ollinger. (Wood Industry -- Faipar -- Vol. 1, No. 5, pp. 144--145, May 1951, 3 figs.)

The initial products of this factory did not meet the requirements of either the domestic, nor the foreign market. The latest type "ON-250" abrasive belt lapping machine is the first independently designed machine for the wood working industry. The machine consists of a housing with two sides, the drive side and the tension side. Foreign make abrasive lapping machines generally operate at a belt speed of 26 to 28 m/sec, while the above mentioned, manufactured in series, operates at a belt speed of 30 m/sec. The article concludes with specifications of the machine.

V 3562. Öllés, G., Investigation of seepage in nonhomogeneous soil under structures (in Hungarian), *Hidrológiai Közöny* 35, 1/2, 3/4; 1-5, 117-123, Jan./Feb., Mar./Apr. 1, 55.

Paper describes seepage studies carried out in a flume with 14 different models, varying sheet-pile lengths and thicknesses of soil layers with different permeability coefficient and with horizontal and dipping surfaces. Author displays in tables and graphs the detailed test results—distribution of potentials, gradients, shape of flow lines, seepage velocities, and quantities of seepage—and gives critical comments and comparisons with the case of homogeneous ground. Some important qualitative statements have been fixed: There exists an unfavorable condition for the structure when (a) soil with lower permeability prevails in the downstream side; (b) the tip of the sheet piles come closer to the stratum with lower permeability; (c) the uppermost layer in the seepage space is less permeable than the lower part.

Vzaimodeystviye etilovykh efirov β -nitrofenilglitsidnykh kislot i p -khlorfenilglitsidnoy kisloty s ammiakom i anilinom)

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 3, pp. 592-601 (USSR)

ABSTRACT: In one of the last works of the authors the reaction of the ethylesters of β -phenylglycidic acid with ammonia and aniline was dealt with; there it was found that all phenylglycidic esters together with nucleophilic groups accumulate amines in the α -position, i. e. just as is done by unsubstituted phenylglycidic esters. For the final solution of the problem concerning the effect of the substituent in the phenylring on the point where the oxide-ring was opened under the action

Card 1/3

Investigation Within the Field of Compounds With a Three-Membered Oxide Ring. 79-28-3-6/61

XX: The Reaction of the Ethylesters of β -Nitrophenyl-Glycidic Acid and γ -Chlorophenylglycidic Acid With Ammonia and Aniline

of the amines it was necessary to investigate the phenyl-glycidic esters which have electron-binding substituents within the phenylring. For this purpose the ethylesters of the following acids were synthetized and investigated: β -(p-nitrophenyl)-, β -(m-nitrophenyl)-, β -(c-nitrophenyl)- and β -(p-chlorophenyl)-glycidic acid. It was found that aniline is added to the ethylesters of β (m-nitrophenyl)-, β -(p-nitrophenyl)- and β -(p-chlorophenyl)-glycidic acid in the α -position. Ammonia is bound at the β -(p-chlorophenyl-glycidic ester) in the α -position, at the β -(m-nitrophenyl)-glycidic esters, however, mostly in the β -position. At β -(p-nitrophenyl)-glycidic ester there is no accumulation of ammonia whatsoever. The ethylester of β -(o-nitrophenyl)-glycidic acid does neither bind aniline nor ammonia. The reaction of the sodium salt of β -(o-nitrophenyl)-glycidic acid with aniline was investigated, in which case no binding at the oxide ring of the glycidic acid takes place (this corresponds to earlier data). The infrared spectra of absorption of all aromatic glycidic esters investigated by the authors

Title : Electrical properties of condensed aromatic hydrocarbon films on aqueous inorganic salt solutions

Periodical : Zhur. fiz. khim. 28/1, 19-25, Jan 1954

Abstract : The diffusion of aromatic hydrocarbons - fluorene, chrysene and dihydro-pyranthrene - on the surface of aqueous inorganic salt solutions, was investigated. It was established that these hydrocarbons form polymolecular films charging positively the surface on which they are deposited. The positive charged surfaces increase with the increase in solution concentration and in the valence of the salt cation. The role of the aromatic structure in the positive charging process of the surface, is explained. The diffusion of non-polar compounds on the surface of solutions and the origination of a positive drop in the contact potential are the result of cation adsorption and polarization of the molecules of the non-polar substance.
